

TWO BRIEFINGS ON THE SAFESIGHT PROPOSAL

Read both pages before the group discussion.

PAGE ONE - Vendor briefing (SafeSight Ltd.)

SafeSight is an AI camera system that identifies risky behaviour in school environments in real time - altercations, bullying situations, unauthorised area access - and alerts staff before incidents escalate.

Key figures from our deployments:

- 92 percent detection accuracy across all monitored behaviours
- A reviewed alert takes staff under 30 seconds on average
- Reference school (11 months): reported incidents down 34 percent

The system flags behaviour, not identity: no face recognition database is built, and video is retained for 72 hours only. Staff always make the final decision; SafeSight only recommends. In our reference deployments, staff describe the dashboard as "a colleague who never blinks."

SafeSight offers your institution a full deployment covering shared spaces (corridors, cafeteria, yard) with staff training included.

PAGE TWO - Statement (Digital Rights Watch)

The vendor's own headline number deserves a second look. 92 percent accuracy means 8 percent of flags are wrong. In a school of roughly 1,100 students, at the alert volumes SafeSight itself reports, that is approximately 90 students every week flagged for behaviour that was not risky at all. The vendor sheet does not say who has those 90 conversations, how a flagged student is approached, or what record remains.

Three further points the vendor sheet omits:

1. The accuracy figure is self-reported and has not been independently audited. No deployment of this system has published its false-flag statistics.
2. Audits of comparable systems consistently show that "risky behaviour" classifiers flag some students more than others - louder students, larger students, students in hoodies. The error rate is not distributed evenly, and the students already under the most scrutiny absorb most of it.
3. Chilling effects are documented: students who know an algorithm is watching change how they gather, speak and move - whether or not they are ever flagged.

A decision to adopt, reject or pilot should not be made from the vendor's page alone. Both pages of this brief describe the same system.
